TITLE OF THE INVENTIONTHROMBIN INHIBITORSBACKGROUND OF THE INVENTION

Thrombin is a serine protease present in blood plasma in the form of a precursor, prothrombin. Thrombin plays a central role in the mechanism of blood coagulation by converting the solution plasma protein, fibrinogen, into insoluble fibrin.

Edwards *et al.*, *J. Amer. Chem. Soc.*, (1992) vol. 114, pp. 1854-63, describes peptidyl α -ketobenzoxazoles which are reversible inhibitors of the serine proteases human leukocyte elastase and porcine pancreatic elastase.

European Publication 363 284 describes analogs of peptidase substrates in which the nitrogen atom of the scissile amide group of the substrate peptide has been replaced by hydrogen or a substituted carbonyl moiety.

Australian Publication 86245677 also describes peptidase inhibitors having an activated electrophilic ketone moiety such as fluoromethylene ketone or α -keto carboxyl derivatives.

R. J. Brown *et al.*, *J. Med. Chem.*, Vol. 37, pages 1259-1261 (1994) describes orally active, non-peptidic inhibitors of human leukocyte elastase which contain trifluoromethylketone and pyridinone moieties.

H. Mack *et al.*, *J. Enzyme Inhibition*, Vol. 9, pages 73-86 (1995) describes rigid amidino-phenylalanine thrombin inhibitors which contain a pyridinone moiety as a central core structure.

In vitro assay for determining proteinase inhibition

Assays of human α -thrombin and human trypsin were performed by the methods substantially as described in *Thrombosis Research*, Issue No. 70, page 173 (1993) by S.D. Lewis *et al.*

The assays were carried out at 25°C in 0.05 M TRIS buffer pH 7.4, 0.15 M NaCl, 0.1% PEG. Trypsin assays also contained 1 mM CaCl₂. In assays wherein rates of hydrolysis of a *p*-nitroanilide (pna) substrate were determined, a Thermomax 96-well plate reader was used to measure (at 405 nm) the time dependent appearance of *p*-nitroaniline. sar-PR-pna was used to assay human α -thrombin ($K_m=125 \mu M$) and bovine trypsin ($K_m=125 \mu M$). *p*-Nitroanilide substrate concentration was determined from measurements of absorbance at 342 nm using an extinction coefficient of $8270 \text{ cm}^{-1} \text{ M}^{-1}$.

In certain studies with potent inhibitors ($K_i < 10 \text{ nM}$) where the degree of inhibition of thrombin was high, a more sensitive activity assay was employed. In this assay the rate of thrombin catalyzed hydrolysis of the fluorogenic substrate Z-GPR-afc ($K_m=27 \mu M$) was determined from the increase in fluorescence at 500 nm (excitation at 400 nm) associated with production of 7-amino-4-trifluoromethyl coumarin. Concentrations of stock solutions of Z-GPR-afc were determined from measurements of absorbance at 380 nm of the 7-amino-4-trifluoromethyl coumarin produced upon complete hydrolysis of an aliquot of the stock solution by thrombin.

Activity assays were performed by diluting a stock solution of substrate at least tenfold to a final concentration = $0.1 K_m$ into a solution containing enzyme or enzyme equilibrated with inhibitor. Times required to achieve equilibration between enzyme and inhibitor were determined in control experiments. Initial velocities of product formation in the absence (V_o) or presence of inhibitor (V_i) were measured. Assuming competitive inhibition, and that unity is negligible compared $K_m/[S]$, $[I]/e$, and $[I]/e$ (where $[S]$, $[I]$, and e respectively represent the total

concentrations, of substrate, inhibitor and enzyme), the equilibrium constant (K_i) for dissociation of the inhibitor from the enzyme can be obtained from the dependence of V_o/V_i on $[I]$ shown in equation 1: $V_o/V_i = 1 + [I]/K_i$ (1).

5 The activities shown by this assay indicate that the compounds of the invention are therapeutically useful for treating various conditions in patients suffering from unstable angina, refractory angina, myocardial infarction, transient ischemic attacks, atrial fibrillation, thrombotic stroke, embolic stroke, deep vein thrombosis, disseminated intravascular coagulation, and reocclusion or restenosis of recanalized vessels. The compounds of the invention are selective compounds, as
10 evidenced by their inhibitory activity against human trypsin (represented by K_i).

Thrombin Inhibitors - Therapeutic Uses- Method of Using

Anticoagulant therapy is indicated for the treatment and prevention of a variety of thrombotic conditions, particularly coronary artery and cerebrovascular disease. Those experienced in this field are readily aware of the circumstances
15 requiring anticoagulant therapy. The term "patient" used herein is taken to mean mammals such as primates, including humans, sheep, horses, cattle, pigs, dogs, cats, rats, and mice.

Thrombin inhibition is useful not only in the anticoagulant therapy of individuals having thrombotic conditions, but is useful whenever inhibition of blood
20 coagulation is required such as to prevent coagulation of stored whole blood and to prevent coagulation in other biological samples for testing or storage. Thus, the thrombin inhibitors can be added to or contacted with any medium containing or suspected of containing thrombin and in which it is desired that blood coagulation be inhibited, e.g., when contacting the mammal's blood with material selected from the
25 group consisting of vascular grafts, stents, orthopedic prosthesis, cardiac prosthesis, and extracorporeal circulation systems.

Compounds of the invention are useful for treating or preventing venous thromboembolism (e.g. obstruction or occlusion of a vein by a detached thrombus; obstruction or occlusion of a lung artery by a detached thrombus),
30 cardiogenic thromboembolism (e.g. obstruction or occlusion of the heart by a detached thrombus), arterial thrombosis (e.g. formation of a thrombus within an artery that may cause infarction of tissue supplied by the artery), atherosclerosis (e.g. arteriosclerosis characterized by irregularly distributed lipid deposits) in mammals,

and for lowering the propensity of devices that come into contact with blood to clot blood.

Examples of venous thromboembolism which may be treated or prevented with compounds of the invention include obstruction of a vein, obstruction
5 of a lung artery (pulmonary embolism), deep vein thrombosis, thrombosis associated with cancer and cancer chemotherapy, thrombosis inherited with thrombophilic diseases such as Protein C deficiency, Protein S deficiency, antithrombin III deficiency, and Factor V Leiden, and thrombosis resulting from acquired thrombophilic disorders such as systemic lupus erythematosus (inflammatory
10 connective tissue disease). Also with regard to venous thromboembolism, compounds of the invention are useful for maintaining patency of indwelling catheters.

Examples of cardiogenic thromboembolism which may be treated or prevented with compounds of the invention include thromboembolic stroke (detached
15 thrombus causing neurological affliction related to impaired cerebral blood supply), cardiogenic thromboembolism associated with atrial fibrillation (rapid, irregular twitching of upper heart chamber muscular fibrils), cardiogenic thromboembolism associated with prosthetic heart valves such as mechanical heart valves, and cardiogenic thromboembolism associated with heart disease.

Examples of arterial thrombosis include unstable angina (severe constrictive pain in chest of coronary origin), myocardial infarction (heart muscle cell death resulting from insufficient blood supply), ischemic heart disease (local anemia due to obstruction (such as by arterial narrowing) of blood supply), reocclusion during or after percutaneous transluminal coronary angioplasty, restenosis after
25 percutaneous transluminal coronary angioplasty, occlusion of coronary artery bypass grafts, and occlusive cerebrovascular disease. Also with regard to arterial thrombosis, compounds of the invention are useful for maintaining patency in arteriovenous cannulas.

Examples of atherosclerosis include arteriosclerosis.

30 Examples of devices that come into contact with blood include vascular grafts, stents, orthopedic prosthesis, cardiac prosthesis, and extracorporeal circulation systems

The thrombin inhibitors of the invention can be administered in such oral forms as tablets, capsules (each of which includes sustained release or timed
35 release formulations), pills, powders, granules, elixers, tinctures, suspensions, syrups,

and emulsions. Likewise, they may be administered in intravenous (bolus or infusion), intraperitoneal, subcutaneous, or intramuscular form, all using forms well known to those of ordinary skill in the pharmaceutical arts. An effective but non-toxic amount of the compound desired can be employed as an anti-aggregation agent.

5 For treating ocular build up of fibrin, the compounds may be administered intraocularly or topically as well as orally or parenterally.

The thrombin inhibitors can be administered in the form of a depot injection or implant preparation which may be formulated in such a manner as to permit a sustained release of the active ingredient. The active ingredient can be
10 compressed into pellets or small cylinders and implanted subcutaneously or intramuscularly as depot injections or implants. Implants may employ inert materials such as biodegradable polymers or synthetic silicones, for example, Silastic, silicone rubber or other polymers manufactured by the Dow-Corning Corporation.

The thrombin inhibitors can also be administered in the form of
15 liposome delivery systems, such as small unilamellar vesicles, large unilamellar vesicles and multilamellar vesicles. Liposomes can be formed from a variety of phospholipids, such as cholesterol, stearylamine or phosphatidylcholines.

The thrombin inhibitors may also be delivered by the use of monoclonal antibodies as individual carriers to which the compound molecules are
20 coupled. The thrombin inhibitors may also be coupled with soluble polymers as targetable drug carriers. Such polymers can include polyvinylpyrrolidone, pyran copolymer, polyhydroxy-propyl-methacrylamide-phenol, polyhydroxyethyl-aspartamide-phenol, or polyethyleneoxide-polylysine substituted with palmitoyl residues. Furthermore, the thrombin inhibitors may be coupled to a class of
25 biodegradable polymers useful in achieving controlled release of a drug, for example, polylactic acid, polyglycolic acid, copolymers of polylactic and polyglycolic acid, polyepsilon caprolactone, polyhydroxy butyric acid, polyorthoesters, polyacetals, polydihydropyrans, polycyanoacrylates and cross linked or amphipathic block copolymers of hydrogels.

30 The dosage regimen utilizing the thrombin inhibitors is selected in accordance with a variety of factors including type, species, age, weight, sex and medical condition of the patient; the severity of the condition to be treated; the route of administration; the renal and hepatic function of the patient; and the particular compound or salt thereof employed. An ordinarily skilled physician or veterinarian

can readily determine and prescribe the effective amount of the drug required to prevent, counter, or arrest the progress of the condition.

Oral dosages of the thrombin inhibitors, when used for the indicated effects, will range between about 0.01 mg per kg of body weight per day (mg/kg/day) to about 30 mg/kg/day, preferably 0.025-7.5 mg/kg/day, more preferably 0.1-2.5 mg/kg/day, and most preferably 0.1-0.5 mg/kg/day (unless specified otherwise, amounts of active ingredients are on free base basis). For example, an 80 kg patient would receive between about 0.8 mg/day and 2.4 g/day, preferably 2-600 mg/day, more preferably 8-200 mg/day, and most preferably 8-40 mg/kg/day. A suitably prepared medicament for once a day administration would thus contain between 0.8 mg and 2.4 g, preferably between 2 mg and 600 mg, more preferably between 8 mg and 200 mg, and most preferably 8 mg and 40 mg, e.g., 8 mg, 10 mg, 20 mg and 40 mg. Advantageously, the thrombin inhibitors may be administered in divided doses of two, three, or four times daily. For administration twice a day, a suitably prepared medicament would contain between 0.4 mg and 4 g, preferably between 1 mg and 300 mg, more preferably between 4 mg and 100 mg, and most preferably 4 mg and 20 mg, e.g., 4 mg, 5 mg, 10 mg and 20 mg.

Intravenously, the patient would receive the active ingredient in quantities sufficient to deliver between 0.025-7.5 mg/kg/day, preferably 0.1-2.5 mg/kg/day, and more preferably 0.1-0.5 mg/kg/day. Such quantities may be administered in a number of suitable ways, e.g. large volumes of low concentrations of active ingredient during one extended period of time or several times a day, low volumes of high concentrations of active ingredient during a short period of time, e.g. once a day. Typically, a conventional intravenous formulation may be prepared which contains a concentration of active ingredient of between about 0.01-1.0 mg/ml, e.g. 0.1 mg/ml, 0.3 mg/ml, and 0.6 mg/ml, and administered in amounts per day of between 0.01 ml/kg patient weight and 10.0 ml/kg patient weight, e.g. 0.1 ml/kg, 0.2 ml/kg, 0.5 ml/kg. In one example, an 80 kg patient, receiving 8 ml twice a day of an intravenous formulation having a concentration of active ingredient of 0.5 mg/ml, receives 8 mg of active ingredient per day. Glucuronic acid, L-lactic acid, acetic acid, citric acid or any pharmaceutically acceptable acid/conjugate base with reasonable buffering capacity in the pH range acceptable for intravenous administration may be used as buffers. Consideration should be given to the solubility of the drug in choosing an The choice of appropriate buffer and pH of a formulation, depending on

solubility of the drug to be administered, is readily made by a person having ordinary skill in the art.

The compounds can also be administered in intranasal form via topical use of suitable intranasal vehicles, or via transdermal routes, using those forms of transdermal skin patches well known to those of ordinary skill in that art. To be
5 administered in the form of a transdermal delivery system, the dosage administration will, of course, be continuous rather than intermittent throughout the dosage regime.

The thrombin inhibitors are typically administered as active ingredients in admixture with suitable pharmaceutical diluents, excipients or carriers
10 (collectively referred to herein as "carrier" materials) suitably selected with respect to the intended form of administration, that is, oral tablets, capsules, elixers, syrups and the like, and consistent with convention pharmaceutical practices.

For instance, for oral administration in the form of a tablet or capsule, the active drug component can be combined with an oral, non-toxic, pharmaceutically
15 acceptable, inert carrier such as lactose, starch, sucrose, glucose, methyl cellulose, magnesium stearate, dicalcium phosphate, calcium sulfate, mannitol, sorbitol and the like; for oral administration in liquid form, the oral drug components can be combined with any oral, non-toxic, pharmaceutically acceptable inert carrier such as ethanol, glycerol, water and the like. Moreover, when desired or necessary, suitable binders,
20 lubricants, disintegrating agents and coloring agents can also be incorporated into the mixture. Suitable binders include starch, gelatin, natural sugars such as glucose or beta-lactose, corn-sweeteners, natural and synthetic gums such as acacia, tragacanth or sodium alginate, carboxymethylcellulose, polyethylene glycol, waxes and the like. Lubricants used in these dosage forms include sodium oleate, sodium stearate,
25 magnesium stearate, sodium benzoate, sodium acetate, sodium chloride and the like. Disintegrators include, without limitation, starch methyl cellulose, agar, bentonite, xanthan gum and the like.

Typical uncoated tablet cores suitable for administration of thrombin inhibitors are comprised of, but not limited to, the following amounts of standard ingredients:

Excipient	General Range (%)	Preferred Range (%)	Most Preferred Range (%)
mannitol	10-90	25-75	30-60
microcrystalline cellulose	10-90	25-75	30-60
magnesium stearate	0.1-5.0	0.1-2.5	0.5-1.5

5

Mannitol, microcrystalline cellulose and magnesium stearate may be substituted with alternative pharmaceutically acceptable excipients.

The thrombin inhibitors can also be co-administered with suitable anti-platelet agents, including, but not limited to, fibrinogen receptor antagonists (e.g. to treat or prevent unstable angina or to prevent reocclusion after angioplasty and restenosis), anticoagulants such as aspirin, thrombolytic agents such as plasminogen activators or streptokinase to achieve synergistic effects in the treatment of various vascular pathologies, or lipid lowering agents including antihypercholesterolemics (e.g. HMG CoA reductase inhibitors such as lovastatin, HMG CoA synthase inhibitors, etc.) to treat or prevent atherosclerosis. For example, patients suffering from coronary artery disease, and patients subjected to angioplasty procedures, would benefit from coadministration of fibrinogen receptor antagonists and thrombin inhibitors. Also, thrombin inhibitors enhance the efficiency of tissue plasminogen activator-mediated thrombolytic reperfusion. Thrombin inhibitors may be administered first following thrombus formation, and tissue plasminogen activator or other plasminogen activator is administered thereafter.

Typical doses of thrombin inhibitors of the invention in combination with other suitable anti-platelet agents, anticoagulation agents, or thrombolytic agents may be the same as those doses of thrombin inhibitors administered without coadministration of additional anti-platelet agents, anticoagulation agents, or thrombolytic agents, or may be substantially less than those doses of thrombin inhibitors administered without coadministration of additional anti-platelet agents,

anticoagulation agents, or thrombolytic agents, depending on a patient's therapeutic needs.

General procedure for making compounds of the invention

Compounds may be prepared, for example, by a common condensation reaction between a group having a carboxylic acid moiety and a group having an amino moiety, forming a peptide or amide bond. Compounds may be prepared by other means however, and suggested starting materials and procedures described below are exemplary only and should not be construed as limiting the scope of the invention.

In general, compounds having the general structure

wherein the variables have the above-described meanings, can be prepared by reacting

under conditions suitable for forming amide bond between the acid and the amine.

3-Fluoroazaindoles

The 3-fluoroazaindoles are prepared by reaction of the azaindole with an electrophilic fluorinating agent such as 1-chloromethyl-4-fluoro-1,4-diazoniabicyclo[2.2.2]octane bis(tetrafluoroborate) in methanolic acetonitrile to give the 2-methoxy-3-fluoroazaindoline. Treatment with base gives the 3-fluoroazaindole. Obvious variations and modifications of the method to produce similar and obvious variants thereof, will be apparent to one skilled in the art.

6-Halogenated pyrazinones

The 6-halogenated pyrazinones are prepared from the unsubstituted pyrazinone by treatment with an electrophilic halogenating reagent such as NBS or NCS. Alternatively, the 6-chloropyrazinones are prepared from 2-chloro-3,5-dibromo-6-hydroxypyrazine by alkylation with an acetate equivalent such as ethylbromoacetate. Displacement with an amine then gives the ethyl 3-amino-5-bromo-1-carboxymethyl-6-chloropyrazinone. The bromine is reductively cleaved with tin hydride and a radical initiator. The 5,6-dichloropyrazinones are prepared

from 2,3,5-trichloro-6-hydroxypyrazine using similar procedures. Obvious variations and modifications of the method to produce similar and obvious variants thereof, will be apparent to one skilled in the art.

Suitable carboxylic acid starting materials for

5  may be prepared according to the following procedures.

Carboxylic acids

METHOD 1

Starting allylamine is condensed with acetaldehyde and cyanide in Step A to afford the aminonitrile. This is reacted in Step B with oxalyl chloride according to the method of Hoornaert [*J. Heterocyclic Chem.*, 20, 919, (1983)] to give the pyrazinone. The olefin is oxidatively cleaved with ruthenium tetroxide and the resulting aldehyde is converted to the acid by an oxidizing agent such as chromic acid in Step C. The 3-chloro group is then displaced by an ammonia equivalent, in this case *p*-methoxybenzylamine in Step D. The remaining chlorine is removed by reduction with Raney nickel in Step E and in Step F the *p*-methoxybenzyl group is removed by treatment with a strong acid such as TFA.

10

15

Typically, solution phase amide couplings may be used to form the final product, but solid-phase synthesis by classical Merrifield techniques may be employed instead. The addition and removal of one or more protecting groups is also
5 typical practice.

Modifications of the method will allow different W, R³, X and A groups contemplated by the scope of the broad claim below to be present by the use of an appropriate reagent or appropriately substituted starting material in the indicated synthetic step. For example the starting aldehyde in Step A can have as its side chain,
10 ethyl, isopropyl, cyclopropyl, trifluoromethyl, and the like, to achieve the different operable values of R³. Likewise, different W groups can be present by the use of an appropriate amine in Step D. Different X groups can be present by the omission of step E, and by the use of a reagent such as oxalyl bromide in step B. Obvious variations and modifications of the method to produce similar and obvious variants
15 thereof, will be apparent to one skilled in the art.

METHOD 2

The acid from METHOD 1, Step C is coupled to the appropriate amine. The 3-chloro group is then displaced by the appropriate amine and a
20 protecting group is then removed, if necessary, to give the final product.

Modifications of the method will allow different W, R³, and X groups contemplated by the scope of the broad claim below to be present by the use of an appropriate reagent or appropriately substituted starting material in the indicated synthetic step. Obvious variations and modifications of the method to produce
25 similar and obvious variants thereof, will be apparent to one skilled in the art.

METHOD 3

An ester of glycine, in this case the benzyl ester, is condensed with acetaldehyde and cyanide in Step A to afford the aminonitrile. This is reacted in Step
30 B with oxalyl chloride to give the pyrazinone. The 3-chloro group is then displaced by the appropriate amine, in this case phenethylamine, in Step C. The ester is hydrolyzed in Step D and the remaining chlorine is then removed by hydrogenolysis in Step E.

METHOD 4

 according to the method of Hoornaert [*J. Heterocyclic Chem.*, 20, 919, (1983)] to give

 in Step C. The 3-chloro group is then displaced by the appropriate amine, in this case

Amide couplings to form the compounds of this invention can be performed by the carbodiimide method. Other methods of forming the amide or peptide bond include, but are not limited to the synthetic routes via an acid chloride, azide, mixed anhydride or activated ester. Typically, solution phase amide couplings are performed, but solid-phase synthesis by classical Merrifield techniques may be employed instead. The addition and removal of one or more protecting groups is also typical practice.

METHOD 5

Formation of [RS]-3-benzyl-7-carboxymethyl-6-methyl-2-oxo-1,2,3,4-tetrahydro-1,7-naphthiridin-[7H]-8-one (5) is a useful intermediate for preparing compounds of the invention.

15 It is prepared as follows:

Step A: Ethyl 6-methyl-3-nitropyridone 4-carboxylate

To a slurry nitroacetamide ammonia salt (70.3 g, 581 mmol) in 400 mL of deionized water was added 100 g (633 mmol, 1.09 equiv.) of ethyl 2,4-dioxovalerate followed by a solution of piperdinium acetate (prepared by adding 36 mL of piperdine to 21 mL of acetic acid in 100 mL of water). The resulting solution was stirred at 40°C for 16 h then cooled in an ice bath. The precipitated product was filtered and washed with 50 mL of cold water to afford the above pyridone as a yellow solid.

25 ¹H NMR (CDCl₃) δ 6.43 (s, 1H), 4.35 (q, J=7 Hz, 2H), 2.40 (s, 3H), 1.35 (t, J=7 Hz, 3H).

Step B: Ethyl 2-methoxy-6-methyl-3-nitropyridine 4-carboxylate

A solution of the pyridone from step A (6.2 g, 27.4 mmol) in 50 mL of DCM was treated with 4.47 g (30.2 mmol) of solid trimethyloxonium tetrafluoroborate and the mixture was stirred at 40°C until the reaction was judged to be complete by HPLC (typically 24-72 h). The reaction mixture was concentrated to one-third volume, loaded onto a silica gel column and eluted with 2:3 EtOAc/Hexane to afford the methoxy pyridine as a yellow liquid.

¹H NMR (CDCl₃) δ 7.2 (s, 1H), 4.35 (q, J=7 Hz, 2H), 4.05 (s, 3H), 2.55 (s, 3H), 1.35 (t, J=7 Hz, 3H).

Step C: 4-Hydroxymethyl-2-methoxy-6-methyl-3-nitropyridine

To a -70°C solution of ester from step B (5.4 g, 22.5 mmol) in 140 mL of DCM was added 56.2 mL (56.2 mmol) of DIBAL-H (1M in hexane) by dropping funnel. The resulting solution was stirred for 1h then warmed to room temperature over an additional hour. The reaction mixture was quenched by the careful addition of saturated NaK tartrate. Stirring was continued for 30 min then the solid was filtered and washed with 100 mL of DCM. The filtrate was extracted with 2 x 50 mL of saturated NaK tartrate then brine (25 mL). The yellow solution was concentrated and chromatographed (2:3 EtOAc/Hexane) to afford the desired alcohol as a yellow solid.

¹H NMR (CDCl₃) δ 7.00 (s, 1H), 4.70 (s, 2H), 4.05 (s, 3H), 2.50 (s, 3H), 2.10 (bs, 1H).

Step D: 4-Formyl-2-methoxy-6-methyl-3-nitropyridine

To a -70°C solution of oxalyl chloride (2.0 mL, 22 mmol) in 50 mL of DCM was added 3.4 mL (44 mmol) of DMSO in 10 mL of DCM by dropping funnel. After 2 min, the reaction mixture was treated with 3.99 g (20 mmol) of the alcohol from step C in 20 mL of DCM. The solution was stirred for an additional 15 min at -70°C , treated with 14 mL (50 mmol) of Et_3N and warmed to ambient temperature over 90 min. The reaction was quenched with 100 mL of water and the two phases were separated. The aqueous phase was extracted with 100 mL of DCM and the combined organic extracts were washed with 50 mL of brine and dried over MgSO_4 . The yellow solution was concentrated and chromatographed (2:3 EtOAc/Hexane) to afford the aldehyde as a yellow solid.

^1H NMR (CDCl_3) δ 10.05 (s, 1H), 7.10 (s, 1H), 4.70 (s, 2H), 4.05 (s, 3H), 2.60 (s, 3H).

Step E: Methyl-2-benzyl-3-(4-[6-methyl-2-methoxy-3-nitropyridyl])-acrylate:

To a 0°C solution of 2-benzyl-trimethylphosphonoacetate (1.36 g, 5.0 mmol) in 25 mL of THF was added 145 mg (4.75 mmol) of NaH. The mixture was stirred for 30 min before the dropwise addition of 930 mg (4.75 mmol) of 4-formyl-2-methoxy-3-nitropyridine in 15 mL of THF. The solution was then heated at 50°C for 3h, cooled and evaporated. The residue was redissolved in 100 mL of EtOAc and quenched to pH=7 with saturated NH_4Cl . The organic phase was washed with brine and dried over MgSO_4 . Column chromatography (2:3 EtOAc/Hexane) afforded the desired olefin as a mixture of E- and Z-isomers.

¹H NMR (CDCl₃) δ 7.60 (s, 1H), 7.40-7.00 (m, 6H), 6.60 (2 singlets, 2H), 4.00 (2 singlets, 6H), 3.75 (2 singlets, 8H), 2.40 (2 singlets, 6H).

Step F: [RS]-3-benzyl-6-methyl-8-methoxy-2-oxo-1,2,3,4-tetrahydro-1,7-naphthiridine:

5

To a solution of nitro olefin from step E (1.6 g, 4.75 mmol) in 50 mL of EtOAc was added 400 mg of 10% Pd/C. Hydrogen gas was added and the solution was heated at 50°C for 16. The reaction mixture was filtered through Celite and the filtrate evaporated. Column chromatography (2:3 EtOAc/Hexane) afforded the bicyclic lactam as a white solid.

10

¹H NMR (CDCl₃) δ 7.45 (bs, 1H), 7.40-7.20 (m, 5H), 6.45 (s, 1H), 3.95 (s, 3H), 3.35 (dd, 1H), 2.80 (m, 2H), 2.60 (m, 2H), 2.40 (s, 3H).

Step G: [RS]-3-benzyl-6-methyl-2-oxo-1,2,3,4-tetrahydro-1,7-naphthiridin-[7H]-8-one:

15

To a 23°C solution of methoxypyridine from step F (700 mg, 2.48 mmol) in 25 mL of dichloroethane was added 8.0 mL (8.0 mmol) of BBr₃ (1M in DCM). An insoluble gum precipitates within 5 min and the reaction was allowed to stir an additional 90 min before quenching to pH = 8 with saturated NaHCO₃. The mixture was diluted with 100 mL of EtOAc and 10 mL THF. The aqueous phase was discarded and the organic solution was washed with 10 mL of water then 10 mL of brine. Evaporation of the solvent left a tan colored solid which was used without further purification.

20

¹H NMR (CDCl₃) δ 8.20 (bs, 1H), 7.40-7.10 (m, 5H), 5.88 (s, 1H), 3.35 (dd, 1H), 2.80-2.50 (m, 4H), 2.25 (s, 3H).

25

Step H: [RS]-3-benzyl-7-t-butoxycarbonylmethyl-6-methyl-2-oxo-1,2,3,4-tetrahydro-1,7-naphthiridin-[7H]-8-one:

To a 23°C solution of pyridone from step G (630 mg, 2.5 mmol) in 20 mL of DMF was added 812 mg (2.5 mmol) of Cs₂CO₃ and 0.37 mL (2.5 mmol) of tert-butyl bromoacetate. The reaction mixture was allowed to stir for 16 h before removal of the solvent *in vacuo*. The mixture was diluted with 100 mL of EtOAc and 25 mL water. The aqueous phase was discarded and the organic solution was washed with 20 mL of brine. Evaporation of the solvent and chromatography (1:1 EtOAc/Hexane) of the resulting oil left the alkylated pyridone as a white solid.

¹H NMR (CDCl₃) δ 7.84 (bs, 1H), 7.33-7.17 (m, 5H), 5.87 (s, 1H), 4.79 (q, J=17.2 Hz, 2H), 3.36 (dd, J=4.1, 13.5 Hz, 1H), 2.79 (m, 1H), 2.65 (m, 2H), 2.48 (m, 1H), 2.23 (s, 3H), 1.48 (s, 9H).

Step I: [RS]-3-benzyl-7-carboxymethyl-6-methyl-2-oxo-1,2,3,4-tetrahydro-1,7-naphthiridin-[7H]-8-one:

To a 0°C solution of ester from step H (310 mg, 0.85 mmol) in 30 mL of DCM was added 8 mL of trifluoroacetic acid. The reaction mixture was allowed to stir to ambient temperature over 5 h before removal of the solvent *in vacuo*. The resulting solid was azeotroped with benzene, EtOAc then ether. This process yielded the desired carboxylic acid as a white solid.

¹H NMR (DMSO-d₆) δ 8.92 (bs, 1H), 7.35-7.10 (m, 5H), 6.04 (s, 1H), 4.75 (q, J=17.2 Hz, 2H), 3.16 (dd, J=4.2, 13.7 Hz, 1H), 2.79 (m, 1H), 2.65-2.40 (m, 3H), 2.1 (s, 3H).

Additional exemplary compounds of the invention, shown in Tables 2 and 3, can be prepared according to the general schemes which follow the table and which are subsequently exemplified.

Tox. **8**, 671 (1995)) in 18.5 mL of ether and 1.5 mL of methanol was added 7.0 mL (14 mmol) of a 2.0 M solution of trimethylsilyldiazomethane in hexane via syringe over a 5 min period until a yellow color persisted. Stirred for 15 min in the cold. In a separate flask, 3.3 g of KOH was dissolved in 8.0 mL of cold water, diluted with 23 mL of ether, and cooled in an ice bath. To this stirred mixture was added 2.65 g (18 mmol) of 1-methyl-3-nitro-1-nitrosoguanidine in portions over a 5 min period. Stirred in the cold for 10 min, removed the aqueous layer by pipette, and added the yellow organic layer to the solution of ester prepared earlier. To this 0°C solution under Ar was added a very small portion of Pd(OAc)₂ which caused vigorous gas evolution. After the reaction had subsided, the flask was removed from the cold bath and the reaction stirred for 0.5 h. The reaction was then poured through a 10 g pad of SiO₂ and eluted with 40 mL of ether to give the title compound as a solution that was used directly in the next step. An aliquot was removed and concentrated to give the title compound as a pale yellow oil:

¹H NMR (CDCl₃) ? 3.88 (s, 3H), 2.0 (td, 2H, 15.8, 7.0 Hz), 0.75-0.85 (m, 1H), 0.50-0.58 (m, 2H), 0.12-0.19 (m, 2H).

The cold reaction mixture was quenched by the dropwise addition of 2M HCl until no further gas evolution was observed. The reaction was extracted with four portions of ether, the combined organic layers washed with water, brine, dried over Na₂SO₄ and the solvents removed by distillation at atm. pressure to give a solution of the product in ethanol. This solution was partitioned between pentane and water, the aqueous layer extracted with three portions of pentane, the combined organic layers dried over MgSO₄ and the solvents removed by distillation at atm. pressure to give the title compound as a colorless oil:

Component	0.25 mg	2 mg	10 mg	50 mg

2, 10 and 50 mg tablets were film-coated with an aqueous dispersion of hydroxypropyl cellulose, hydroxypropyl methylcellulose and titanium dioxide, providing a nominal weight gain of 2.4%.

Tablet preparation via direct compression

Active IV, mannitol and microcrystalline cellulose were sieved through mesh screens of specified size (generally 250 to 750 μ m) and combined in a suitable blender. The mixture was subsequently blended (typically 15 to 30 min) until the drug was uniformly distributed in the resulting dry powder blend. Magnesium stearate was screened and added to the blender, after which a precompression tablet blend was achieved upon additional mixing (typically 2 to 10 min). The precompression tablet blend was then compacted under an applied force, typically ranging from 0.5 to 2.5 metric tons, sufficient to yield tablets of suitable physical strength with acceptable disintegration times (specifications will vary with the size and potency of the compressed tablet). In the case of the 2, 10 and 50 mg potencies, the tablets were dedusted and film-coated with an aqueous dispersion of water-soluble polymers and pigment.

Tablet preparation via dry granulation

Alternatively, a dry powder blend is compacted under modest forces and remilled to afford granules of specified particle size. The granules are then mixed with magnesium stearate and tableted as stated above.

To 80mL of fuming sulfuric acid at 0°C was added in small portions 27mL(233.3mMol) of 2,4-lutidine. To this solution was added in small portions 47.2g(466.6mMol, 2eq.) of potassium nitrate and the resulting solution was heated at 170°C for 0.5h. This was then poured into 1L of ice and solid sodium bicarbonate was added in small portions with vigorous stirring until the pH was neutral. This was extracted with diethyl ether which was dried(Na_2SO_4) and concentrated in vacuo. Purification by flash silica gel chromatography using methylene chloride as the eluent afforded a 3/2 mixture of 2,4-dimethyl-5-nitropyridine(1) and 2,4-dimethyl-3-nitropyridine(2) in the form of a yellow oil.

The reaction was filtered through a bed of celite and the filtrate concentrated in vacuo. Purification by flash silica gel chromatography using methanol/methylene chloride as the eluent afforded 2,4-dimethyl-5-aminopyridine(3) in the form of a clear colorless oil.

The mixture was shaken under an atmosphere of hydrogen (40 psi) at ambient temperature for 18 h on a Parr apparatus. The catalyst was removed by filtration and the solvent was removed in vacuo to give the title compound as an oil (2.5 g, HPLC RT = 3.96 min, method A).

Step 8. 3-(1-tert-Butyloxycarbonyl-trans-4-(2-pyridyl)-pyrrolidin-3-ylamino)-1-ethoxycarbonylmethylpyrazinone

The mixture was cooled to ambient temperature, diluted with EtOAc, and washed with aqueous NaHCO₃. The organic phase was separated, dried over MgSO₄, filtered, and concentrated in vacuo. The residue was purified by flash column chromatography using a gradient elution of 60-85% EtOAc:hexanes to give the title compound as an amorphous solid (3.4 g; TLC R_f = 0.5, 4:1 EtOAc:hexanes; HPLC RT = 5.92 min, method A).

Step 9. 3-(1-tert-Butyloxycarbonyl-trans-4-(2-pyridyl)-pyrrolidin-3-ylamino)-6-chloro-1-ethoxycarbonylmethylpyrazinone

A stirred solution of 3-(1-tert-butyloxycarbonyl-trans-4-(2-pyridyl)-pyrrolidin-3-ylamino)-1-ethoxycarbonylmethylpyrazinone from step 8 above (2.0 g, 4.5 mmol) and N-chlorosuccinimide (0.67 g, 5.0 mmol) in CHCl₃ was heated to reflux for 6 h. More N-chlorosuccinimide (0.20 g, 1.5 mmol) was added and refluxing was continued for 12 h. The reaction was diluted with CHCl₃ and washed with aqueous NaHCO₃. The organic phase was separated, dried over Mg SO₄, filtered, and concentrated in vacuo. The residue was purified by flash column chromatography using a gradient elution of 25-50% EtOAc:hexanes to give the title compound as an amorphous solid (1.5 g, TLC R_f = 0.5, 1:1 EtOAc:hexanes; HPLC RT = 7.17 min, method A).

Step 10. 3-(trans-4-(2-Pyridyl)-pyrrolidin-3-ylamino)-6-chloro-1-ethoxycarbonylmethylpyrazinone

Into a stirred solution of 3-(1-tert-butyloxycarbonyl-trans-4-(2-pyridyl)-pyrrolidin-3-ylamino)-6-chloro-1-ethoxycarbonylmethylpyrazinone from step 9 above (0.8 g, 1.8 mmol) in EtOAc (25 mL) at 0°C was bubbled HCl gas for 10 minutes. The mixture was stirred at 0°C for 30 min and then at ambient temperature for 30 min. The solvent and excess HCl were removed in vacuo and the residue was trituated in ether to give the HCl salt of title compound as an amorphous solid (0.68 g, HPLC RT = 4.54 min, method A).

Step 11. 3-(1-Methylsulfonyl-trans-4-(2-pyridyl)-pyrrolidin-3-ylamino)-6-chloro-1-ethoxycarbonylmethylpyrazinone

To a stirred solution of the hydrochloride salt of 3-(trans-4-(2-pyridyl)-pyrrolidin-3-ylamino)-6-chloro-1-ethoxycarbonylmethylpyrazinone from step 9 above (0.2 g, 0.48 mmol) in CH₂Cl₂ (20 mL) at 0°C was added DIEA (0.30 mL, 1.7 mmol) and methanesulfonyl chloride (63 mg, 0.55 mmol). The resulting solution was stirred at 0°C for 6 h and then at ambient temperature for 12 h. The mixture was diluted with CH₂Cl₂ and aqueous NaHCO₃. The organic phase was separated, dried over MgSO₄, filtered, and concentrated in vacuo. The residue was purified by column chromatography using a gradient elution of 2-4% MeOH:CH₂Cl₂ (0.20 g, TLC R_f = 0.5, 95:5 CH₂Cl₂:MeOH; HPLC RT = 5.47 min, method A).

Step 12. 3-(1-Methylsulfonyl-trans-4-(2-pyridyl)-pyrrolidin-3-ylamino)-6-chloro-1-carboxymethylpyrazinone

5 A solution of 3-(1-methylsulfonyl-trans-4-(2-pyridyl)-pyrrolidin-3-ylamino)-6-chloro-1-ethoxycarbonylmethylpyrazinone from step 11 above (0.20 g, 0.47 mmol) and aqueous NaOH (0.18 mL of a 4.0 N solution, 0.71 mmol) in EtOH (7 mL) was stirred at ambient temperature for 2 h. Aqueous HCl (0.12 mL of a 6.0 N solution, 0.72 mmol) was added, and the solvents were removed in vacuo to give the title compound as an amorphous solid containing NaCl (0.2 g, HPLC RT = 3.99 min, method A).

10

Step 13. 3-(1-Methylsulfonyl-trans-4-(2-pyridyl)-pyrrolidin-3-ylamino)-6-chloro-1-(7-azaindol-5-ylmethylaminocarbonylmethyl)pyrazinone

The solution was brought to pH 7 by the addition of DIEA (approximately 0.1 mL). EDC (70 mg, 0.24 mmol) was added and the solution was stirred at ambient temperature for 18 h. The reaction was loaded directly onto an automated preparative HPLC unit and chromatographed using

20

a gradient elution of 95:5:0.1 to 50:50:0.1 H₂O:CH₃CN:TFA. The fractions containing the desired product were combined and lyophilized to give the TFA salt of the title compound as an amorphous solid (65 mg, HPLC RT = 4.07 min, method A; M + 1 peak at m/z = 557, electrospray mass spec).

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This international report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:
2. ☐ Claims Nos.:
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

Please See Extra Sheet.

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☒ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
1-11 wherein A is the second formula
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

BOX II. OBSERVATIONS WHERE UNITY OF INVENTION WAS LACKING

This ISA found multiple inventions as follows:

This application contains the following inventions or groups of inventions which are not so linked as to form a single inventive concept under PCT Rule 13.1. In order for all inventions to be searched, the appropriate additional search fees must be paid.

Group I, claim(s) 1-6, 9-11 (all in part), drawn to pyridones wherein A is the first and third formulas in claim 1.

Group II, claim(s) 1-11 (all in part), drawn to pyrazinones wherein A is the second formula in claim 1.

Group III, claim(s) 1-11, drawn to 1,2,3,4-tetrahydro-1,7 naphthridine[7H]-8-ones wherein A is the fourth formula in claim 1.

The inventions listed as Groups I-III do not relate to a single inventive concept under PCT Rule 13.1 because, under PCT Rule 13.2, they lack the same or corresponding special technical features for the following reasons: compounds having pyridones and pyrazinones have other use such as being integrin antagonists. Note US patent 5,981,546 (Duggan et al). Furthermore, compounds having indoly methyl carbonyl methyl group have other use such as being central muscle relaxant. Note CA 129:302552.
